

**National Interagency Coordination Center  
Incident Management Situation Report  
Friday, April 25, 2014 – 0800 MT  
National Preparedness Level 1**

**National Fire Activity (Weekly Total)**

Initial attack activity: Light (1,117 new fires)  
 New large fires: 24 (\*)  
 Large fires contained: 19  
 Uncontained large fires: \*\* 10  
 Area Command Teams committed: 0  
 NIMOs committed: 0  
 Type 1 IMTs committed: 0  
 Type 2 IMTs committed: 0

\*\* Uncontained large fires include only fires being managed under a full suppression strategy.

**Predictive Services Discussion:**

Cool and unsettled weather will continue across the Northwest and Intermountain regions through the weekend as another wet Pacific storm system moves through with abundant precipitation, including snow for the Sierra Nevada Mountains. On the southern periphery of this trough it will remain dry and breezy for eastern New Mexico and west Texas. By Monday this system will intensify as it crosses the Rocky Mountains onto the Plains. It will be accompanied by a strong cold front as it moves through the Midwest and into the Great Lakes region, bringing thunderstorms and cool weather by the middle of next week. The western U.S. will see a ridge of high pressure building by early next week for warming and drying with above normal temperatures and light winds.

## Hydration

*Firefighter Health & First Aid*

Dehydration is the result of the body trying to regulate its temperature naturally through sweating. Maintaining body fluids is essential for sweating. You must hydrate before, during, and after work.

- Studies conducted on wildland firefighters indicate that during fire suppression activities firefighters need to drink a minimum of 1 quart of fluid each hour of work.
- Before work you should take extra fluids to prepare for the heat. Drink 1 or 2 cups of water, juice, or a sport drink before work.
- While working drink at least 1 quart of fluid per hour. Drink as much as you can during the lunch break. Water is your greatest need during work in the heat.
- Hyponatremia (abnormally low concentration of sodium in the blood) as a result of excessive water intake a potentially life-threatening complication and can be prevented when rehydration is enhanced by fluids containing sodium and potassium, or when foods with these electrolytes are consumed along with water.
- After work it is important to continue drinking to replace fluid losses. Thirst always underestimates fluid needs, so you should drink more than you think you need.
- Unacclimatized workers lose more salt in the heat so they need to pay particular attention to salt replacement.
- Don't overdo salt intake; too much salt impairs temperature regulation. Excessive salt can cause stomach distress, fatigue, and other problems.
- You can assess your hydration by observing the volume, color, and concentration of your urine. Low volumes of dark, concentrated urine or painful urination indicate a serious need for rehydration. Other signs of dehydration include a rapid heart rate, weakness, excessive fatigue, and dizziness.
- Rapid loss of several pounds of body weight is a certain sign of dehydration. Rehydrate before returning to work; continuing to work in a dehydrated state can lead to serious consequences, including heat stroke, muscle breakdown, and kidney failure.

### Discussion Points

- What are you doing right now to ensure that you are hydrated?
